The Benefits of Sage CRM Internet Architecture

Sage CRM

Contents

Introduction

Investing in a Customer Relationship Management (CRM) application is no different than any other business management software investment — whether you are looking for an enterprise level software application or a department level solution, you expect a quick and measurable return on your investment. Before investing in a CRM application, consider several aspects of the application including its features, support for existing and emerging technologies, initial cost, ease of use, integration with other applications, and more. One of the most important aspects of a business management application, including a CRM application, is its underlying architecture. A well-designed architecture will accommodate future growth and adapt to business changes without affecting the performance of the application or requiring an exhaustive re-implementation. An application's customisability, adaptability, portability, scalability and extensibility are all functions of its architecture.

In an internet architecture, the corporate data, the operations performed on that data, and the user interfaces are built in clearly defined layers that communicate using internet standards[1]. Internet architecture is characterised by central-server installation, thin client deployment, centralised administration, portable application, and optimised performance on WANs. The internet architecture of Sage CRM offers superior performance across all user deployment scenarios including disconnected access (laptop), internet access (wired and mobile), dial-up access, and in-office access.

This document describes the underlying architecture of Sage CRM and explains how the application of its internet architecture can become a competitive advantage for your firm.

---

[1] Sage CRM utilises the following internet standards and technologies: TCP/IP, Hyper-test Transport Protocol (HTTP), ActiveX, JavaScript, Active Server Page (ASP), File Transfer Protocol (FTP), Simple Mail Transfer Protocol (SMTP), eXtensible Markup Language (XML), Web Server, Web Browser and Secure Sockets Layer (SSL).

Sage CRM Internet Architecture

Most CRM applications—even applications with web interfaces—are built using a client / server architecture, with the administrative overhead and expense of support for both deployment paradigms. Sage CRM, however, is powered by a pure internet architecture that leapfrogs the client /server technology prevalent today. As shown in Figure A below, the internet architecture of Sage CRM includes three distinct layers that communicate amongst themselves using internet standards.

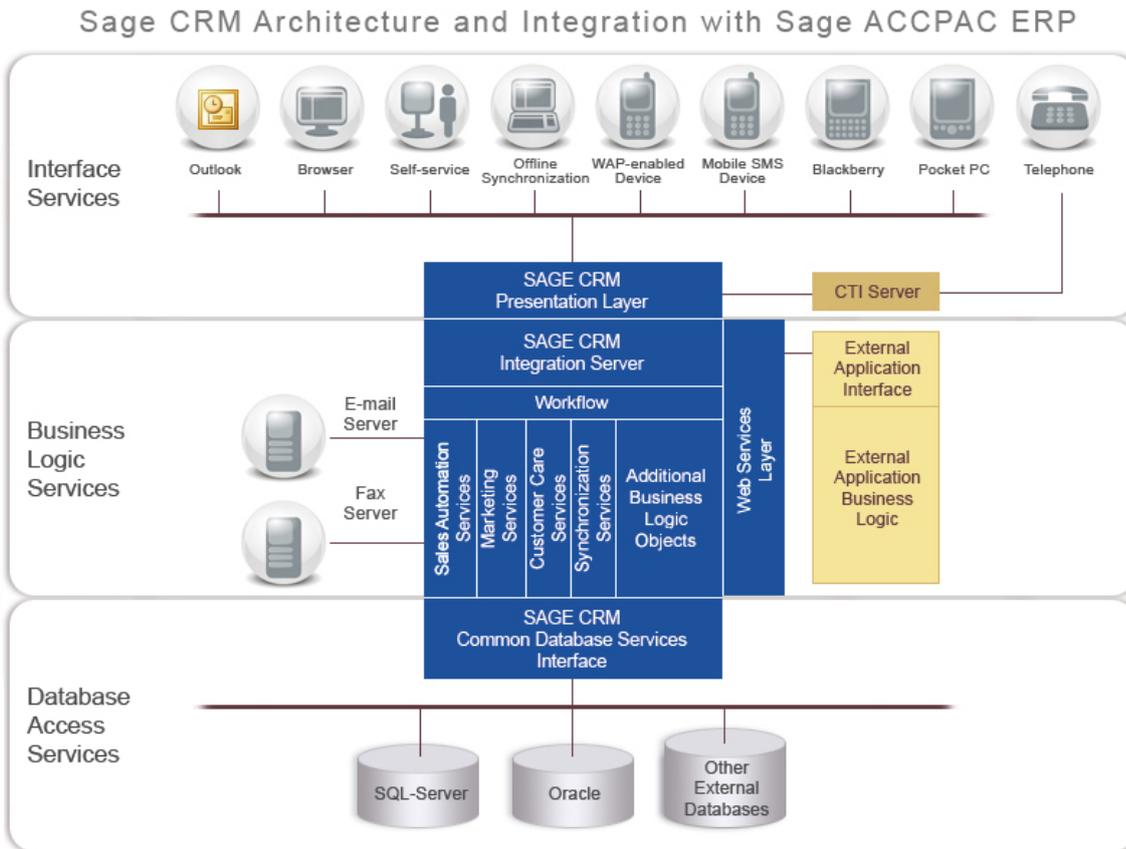

Figure A

Interface Services

Traditional methods of communication between vendor and customer such as phone, fax and mail have been augmented by web, e-mail and mobile communications (xhtml-mp, mobile internet, etc.). In today's economy, internet access, both wired and mobile, is the fastest growing access method to business information. Sage CRM's internet architecture provides universal access to CRM applications for the mobile workforce by delivering the solution within a standard Web browser, Mobile html enabled device, mobile SMS device and Personal Digital Assistant (PDA).

The mobile and internet device layers (components of the Sage CRM Presentation Layer) manage the connection between the Sage CRM application and the Microsoft internet Information Server (IIS). The

4
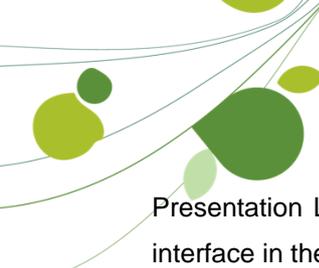

Presentation Layer detects the device type being used (browser, PDA, mobile, etc.) and outputs the user interface in the format most appropriate for that device.

Business Logic Services

The internet architecture of Sage CRM provides a framework that enables companies to integrate information from multiple applications into CRM solutions, making this consolidated information available through an intranet, the internet, and/or mobile internet platforms.

The Business Logic Services layer exposes business functions such as opportunity management, customer service, marketing automation, territory assignment, customer self-service, and workflow. These functions have several components that work together to coordinate the delivery of information and functionality to clients. These components check user security, maintain user persistence (remember what a user is doing), synchronise data with mobile users, return information from the database, generate Web pages from data, perform transactions, process business rules and logic, and much more.

Exactly which functions are available to Sage CRM users is managed by the server side Sage CRM Dynamic Link Library (DLL). The DLL communicates with the web server using internet Server Application Programming Interface (ISAPI) technologies.

From version 7.0 onwards, the server-side also contains a Java server that hosts the Interactive Dashboard Web 2.0 feature and the CRM SData Provider.

Database Access Services

All database operations in Sage CRM are performed through components of the Common Database Services Interface (CDSI) layer. To maintain data integrity, the CDSI layer validates data updates, such as sales leads being imported to CRM from an external application, before they are written to its database. This validation prevents any new data from corrupting the database or creating duplicate records on the server. The database server can be located on the same platform or on a separate network-connected server. Sage CRM stores, retrieves and collates data from these databases, and presents it in a uniform manner to the user.

BENEFITS OF SAGE CRM INTERNET ARCHITECTURE

Single Server Installation and Centralised Management

Sage CRM may reside on a central server(s) with full access to the CRM solution provided via an internet browser. This also allows administration of the CRM system to be more manageable and less expensive. Users of the application benefit, as they can access the centralised database anywhere, anytime.

This single server installation makes Sage CRM a highly cost-effective solution for companies with mobile employees and multiple offices worldwide, as well as for companies with large numbers of employees in a single building, where a typical client / server deployment can be difficult and expensive to maintain. Companies no longer need to waste time and money on multiple copies of the same software or installing upgrades on every PC across the organisation. Moreover, this internet architecture eliminates the need for organisations to make investments in expensive and maintenance-intensive technologies to facilitate remote connectivity such as Citrix or Microsoft Terminal Server.

For connected mobile users, such as employees in remote offices that are accessing the application over the internet or travelling executives working from their hotel rooms, Sage CRM's internet architecture allows secure access through an internet browser, PDA, or a mobile phone device. To access CRM using a mobile device, a connection needs to be established through an internet connection managed by the mobile telephone company and the CRM server must have a static IP Address accessible over the Internet.

For disconnected mobile users, such as field salespersons and support personnel that are accessing the application without connecting to the internet, Sage CRM's internet architecture allows them to work from a personalised local copy of the central database. Users can synchronise over the LAN, or via the internet. Sage CRM even synchronises documents from the document library, a central repository of all documents that are exchanged and referenced in Sage CRM.

Scalability

Sage CRM is designed to accommodate change and grow with you. Sage CRM is an open system that is built on industry standard technology. By virtue of the unique internet architecture of Sage CRM, companies can manage exponential growth in their businesses and simultaneously maximise their returns from the application. Companies can choose to add the Computer Telephony Integration (CTI) module of Sage CRM, providing telephone switch integration for in-bound and out-bound calls within the Sage CRM interface.

Many CRM systems marketed to small and medium-size companies economise by using a two-tier client / server architecture – over simplifying the system by eliminating the server tier and requiring each client to manage its own connection to a database. The lack of a true middle tier means that there is no central

6

distribution of processing and that the database itself must directly support every client. Two-tier deployment models will not scale to a large number of users or to large data transfer requirements. Hence, these models are ill-suited architecture upon which to build robust, scalable, and adaptable solutions. To handle high transaction volume, Sage CRM can allow for multiple application servers, running in parallel against the same database. Such multi-tier deployment can spread processing loads across multiple machines, thereby supporting the increased transactional throughput and only requiring the addition of inexpensive PC servers.

Typically, with an increase in the number of users, the performance of a client / server application can degrade. However, Sage CRM's internet architecture relies on thin network implementation, with the average Sage CRM web page being between 5k and 15k (no heavy, proprietary communication traffic between client and server, just HTML and XML). Sage CRM pools all database connections used to handle incoming requests. Connection pooling enhances the performance of executing commands against a database. Before executing a command on other systems, a connection to that database needs to be established. After the command is executed, the connection is broken. Sometimes creating and terminating the connection is more costly in time than executing the command. For this reason, connection pools within Sage CRM are created to keep connections alive. After a connection is created, it is placed in the connection pool. Connections are then used from the pool so that database resources are required to establish a new connection. Only if all connections in the pool are being used, new connections are created and made available through the pool. These connections are shared amongst all logged on users, eliminating the need to have one open database connection for each user, even when the user isn't currently using the system.

Adaptability

Sage CRM provides easy to use customisation tools, so companies can adapt the application to existing and future needs. Sage CRM adapts to changing business process flows, and current and emerging technologies, thereby protecting your investment. Sage CRM's open API, called the Integration Server, allows for ease of integration and customisation. The Integration Server makes integration, modification and customised implementations easy and cost-effective. Trained users can make frequent and significant functionality changes and additions as their business needs dictate, all without an expensive reimplementation. Customisation is made through a web interface and stored in a centrally located metadata database[2]. Any changes to the applications, such as the addition of fields or user interface enhancements, are delivered "on the fly" the next time the user connects to Sage CRM, essentially eliminating roll-out time associated with providing additional features or enhancements. Further, the Sage CRM development environment allows seamless re-use of business logic between connected and disconnected applications.

Figure B illustrates the typical customisation environment

---

[2] Metadata is data about the database. It describes the structure and meaning of the database. Let us assume, "Leads" is one of the database tables in Sage CRM and it is modified to include three additional fields. Metadata table will include descriptive and "properties" information about the "Leads" database table object, and characteristics of the three additional fields. Similarly, any changes to data entry screens, lists, drop-downs, field characteristics, etc. are all stored in metadata, within the Sage CRM database.
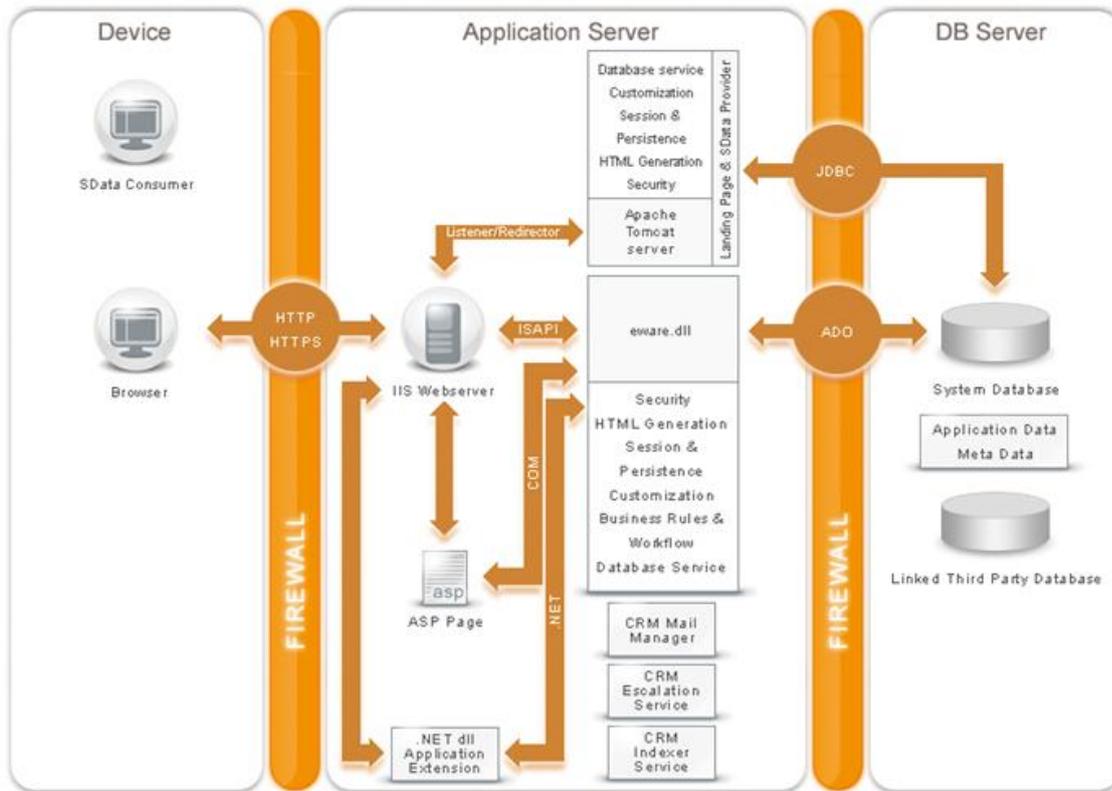

Figure B: Typical Customisation Environment

With Sage CRM, the following customisation types can be developed:

Customisation	Description
User Interface	All user interfaces that a user sees (menus, screens, entry boxes, grids, buttons, etc.) take their definition from properties and events stored in the metadata database and provide entry, display, validation and database services for easy display and entry of information in a browser. User interface customisations support web and mobile users from a single application. Sage CRM generates the appropriate client interface for each user.
Session Management	Store information about users and user sessions, tracking the action of users, and enabling user preferences and settings.
Database	Manage access to data, locking, caching and pooling of database connections. They provide the ability to create a Web-based frontend for legacy systems.
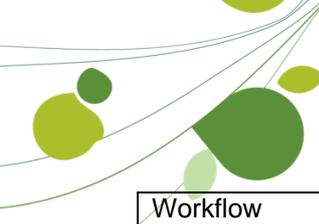

Workflow	Monitor and execute workflows and escalations.
Graphics	Generate platform-independent graphics and charts.
Messaging	Integrate with standard messaging systems including e-mail, SMS and WAP-Push.
Business	Created to perform or access existing business functions / calculations using ASP/COM, .Net, DCOM, and XML interfaces.

Sage CRM Web Self-Service

Sage CRM also provides a Web Self-Service module that gives customer, user, and partner access to a subset of its data through a customisable Self-Service site. Sage CRM Web Self-Service is a tool that helps integrate a company's existing corporate website with the Sage CRM application, allowing end-to-end continuity and closed loop marketing integration without the need for a separate system.

Sage CRM Web Self-Service components enable users to view and input data into customised web pages, showing and updating information most relevant to the team success including communication, transactional and contact history. Using Self-Service tools, a company can allow its customers to selectively interact with its client database, thereby freeing up some of its internal resources and allowing the customer to "help themselves."

Sage CRM Multicurrency and Multiple Language Support

Sage CRM concurrently supports users in multiple languages, regions, time zones and currencies, all from a single codebase. Even if your users are all in one country, your customers and partners may be more geographically diverse, requiring localised interaction with the centralised data. All captions, lookups, etc. are stored in reference tables and are used to dynamically build web pages and screens in the users' chosen language. Moreover, Sage CRM provides multilingual support from a single codebase and allows users to share a single language-independent database. Multicurrency support allows users to use the system with one or more currencies and run reports in any currency.

Automated Workflow

Sage CRM includes built-in workflow functionality. The Sage CRM workflow engine routes information such as sales opportunities, support cases, etc, using a comprehensive set of communication options, including escalations, alerts (using e-mail, SMS and pop-up message) and alarms. Workflow in Sage CRM is designed

specifically to control and direct a communication process. It revolves around the concept of interactions, notifications, reactions and inter-departmental communications.

Sage CRM utilises workflow agents to extend the reach of enterprise applications - allowing employees, customers and suppliers to access CRM applications whenever and wherever they need them. Using this model, for example, salespeople can be alerted to leads immediately allowing them to respond rapidly to customer inquiries. Business executives can receive alerts while they are on the road, allowing them to spot trends and pursue new opportunities as they emerge. Mobile technology brings users a fast, easy to use interface delivering the access that users need on the road.

Sage CRM not only ensures rapid routing and dispatching of mobile service workflow agents, it also ensures that all members of an account team receive critical information about the customer — as it happens. Using workflow agents, Sage CRM can increase the speed, accuracy and scope of automated business processes. Additionally, workflow items can be routed and completed in less time. Manual processes that occur far away from desks and desktops can also be automated.

Rapid Deployment

Sage CRM is easy to deploy, manage and modify, thus reducing total cost of ownership and implementation. The application is designed with rapid deployment in mind, offering straightforward customisation options and strong integration capabilities.

Many early CRM solutions come from an era of long implementations, where deployment timelines of over a year are common. Today businesses cannot endure such lengthy cycles because of the high expense associated with long implementations and the changing needs of business over a relatively short time. Moreover, over time a partially deployed CRM application might offer inconsistent and incomplete information to its users, defeating its very purpose of providing a 360-degree view of the company to its customers and a 360-degree view of customers to the company.

Secure Access

From day one, the architecture of Sage CRM was designed for internet access and for running securely within a corporate IT security infrastructure. Sage CRM is modelled on an n-tier[3] architecture, and each tier includes a number of security mechanisms.

---

[3] N-Tier means any number of tiers. The N-Tier model of computing provides the ability to distribute independent components or services over as many tiers as makes sense and then link them dynamically, in order to provide unlimited application flexibility. Programs partitioned into tiers allow each layer or component part to be developed, managed, deployed and enhanced independently.
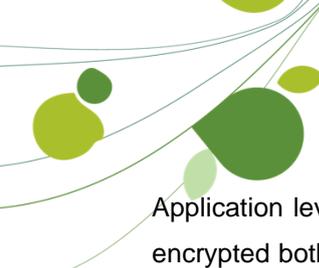

Application level security in Sage CRM is based on the supplied user and password. A user's password is encrypted both within the administrative functions in the system and in the back-end database for maximum security. The System Administrator can change, but not view an existing user's password. Functions within the application are available based on user group, user profile, team and territories, and both record-level and field-level security options are available. Additional security is applied to Self-Service users, such as customers, partners, etc.

Users can access the master system anywhere in the world using a web browser. If they have a laptop or mobile device and an internet connection, they can easily synchronise their data with the master system. Security within the Sage CRM Integration Server ensures the integrity of user security, system security, data segmentation and profiles.

Server level security includes NT Challenge / Response, Secure Sockets Layer (SSL) Encryption and support for Firewalls. SSL encryption secures data sessions with client users. When an SSL session is started, the server sends its public key to the browser. The browser then uses the key to send a randomly generated secret key back to the server in order to have a secret key exchange for that session. When the web server uses SSL encryption, Sage CRM Self-Service is aware of this. Firewall types supported by CRM include packet filter, proxy server, network address translation (NAT) and state inspection. Sage CRM can operate behind a firewall to protect the server, and limit only certain types of interactions to take place.

The CRM Web-based Self-Service option works with standard Firewall encryption and authentication technology to provide secure internet access to customers, partners and prospects. For additional security, the CRM Self-Service server can be physically separated from the CRM server, and a firewall can be set up to further protect the CRM server. Within a Self-Service ASP page, a screen can be designed as read-only or editable, restricting what different users can do on the page. User passwords can be allocated at the person or company level.

Database level security ensures that no user has direct access to the database. All database access is performed via the Sage CRM DLL. For additional security, this DLL can be configured to access the database using a login with limited access.

Integration with Business Applications

Sage CRM offers integration with legacy systems; back-office systems such as accounting, supply chain, other corporate databases, etc. partner information systems such as knowledge base, Web Self-Service, etc. and public information systems such as corporate web sites, credit rating web sites, etc.

Integration with line-of-business applications dramatically increases productivity of users. To inquire on the transactions of a customer, a Sage CRM user need not switch and log into a second application. Integrated information is available with a click of a button, anytime, anywhere. With real-time integration, users are able to view the latest information from either application. With this single point of entry, availability of integrated

information, and ability to run business electronically, companies can lower their unit cost transactions and increase efficiency.

Once a connection is made to existing legacy systems or line-of-business applications, the user interface can be customised using the same web-based administration and customisation tools used to customise standard CRM functionality.

Sage CRM integrates with Microsoft applications for increased productivity and improved communications. Bi-directional integration with Microsoft Exchange benefits non-Sage CRM users, who use Microsoft Outlook for scheduling and e-mailing, by providing access to view both Sage CRM and Outlook calendaring, task and interaction management functions. This integration allows non-Sage CRM users and Sage CRM users to interact, removing inter-departmental communication barriers. Users can set up appointments that include both Sage CRM and non-Sage CRM users, and these schedules are reflected on both systems — Microsoft Exchange and Sage CRM. Mail merged documents can be created using Microsoft Word, and such documents can be stored in Sage CRM for future reference. The Document Library within Sage CRM can be used as a central repository for all file types from quotes to contracts, schematics to maps. With a single click of a button, a Sage CRM user has access to all documents relating to sales opportunities, support cases, companies and / or contacts. The user need not search through physical filing cabinets to look for a document while the customer is on the phone. A simple process of dragging and dropping a document can initiate a workflow for document approval and archival purposes for example. Company, contact and lead data can be imported in Microsoft Excel format, and CRM reports can be exported in Excel format for further analysis. To integrate with business applications, Sage CRM uses three types of interface; COM/ASP, Web Services and .Net. Because the data flowing into Sage CRM is validated by the Business Logic Services, data integrity is maintained. Mail-merged documents can be e-mailed, printed or faxed from within the application.

Typical Configuration for Sage CRM

Sage CRM can be deployed in internet and / or intranet environments. A single Sage CRM Application Server can serve both web-based and mobile clients within or outside the firewall. The entire functionality of Sage CRM, along with the integrated functionality of external applications, is available to remote users, self-servicing customers, partners and prospects. Figure C illustrates a typical Sage CRM configuration.
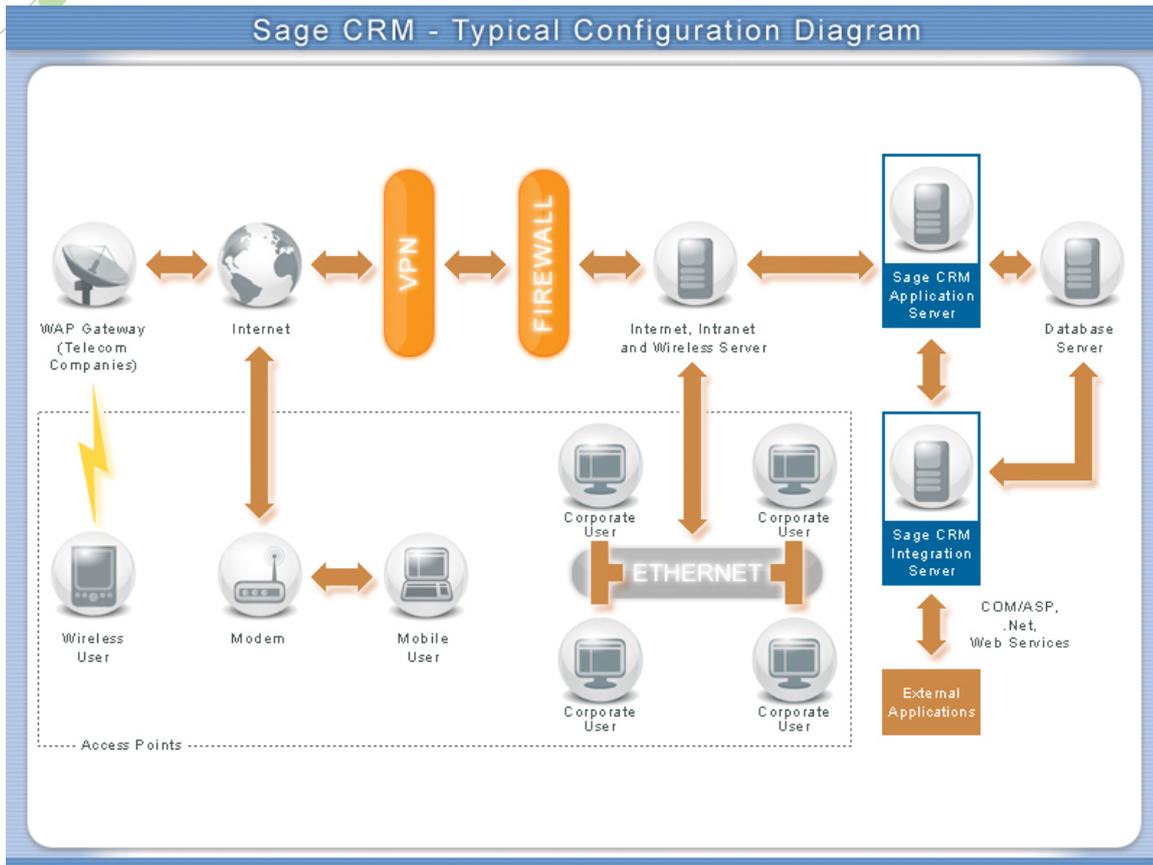

Figure C: Typical Sage CRM Installation

Components of Sage CRM Configuration

Web Client	Supports requests from industry standard web browsers and automatically renders the correct markup language for the requesting browser.
Mobile Client	Supports mobile devices. User Interface Services of Integration Server are used for implementing mobile enablement.
WAP Gateway	Receives requests through gateways operated by mobile network operators and also private corporate gateways from select suppliers.
internet / intranet Server	Supports Windows NT / Windows 2000 / 2003 server-based web servers running internet Information Services (IIS).
SMS Gateway & E-mail Server	Supports workflows with alerts, reminders, notifications and escalations. These can be transmitted to Web clients and / or as SMS messages through any SMTP compliant SMS gateway or as e-mails through a standard SMTP/POP e-mail server.

Database Server	Includes native driver support for Microsoft SQL Server, DB2 and Oracle.
Network	Supports TCP/IP network on a Local Area Network (LAN), Virtual Private Network (VPN) or internet.
Application Server	Coordinates with all other components of the application. Includes components from all three layers of the internet architecture.

Closing Comments

Many CRM solutions are available that provide a unified way to organise, analyse and understand customer data for sales, marketing, and customer support personnel. Sage CRM is at the forefront of technological innovations in the CRM marketplace through its unique internet architecture, providing uncompromised performance and unparalleled ease of installation, customisation and versatility. Sage CRM provides the low cost and ease of installation of turnkey software, with the customisation capabilities of a bespoke solution, allowing companies to implement it quickly and economically, without sacrificing degree of fit or adaptability. It is affordable, not only in terms of the initial purchase price, but also in overall cost of ownership to implement, maintain, update and expand.

Sage CRM offers outstanding end-to-end CRM functionality — from lead generation to sales to support — while providing an architectural foundation unique in the industry, that adds value both at installation time and for the lifetime of the business. Investing in Sage CRM is a smart business decision which guarantees quick returns and future protection. Sage CRM is a vital component of any end-to-end e-business strategy.

About Sage CRM

Sage CRM is an easy-to-use and fast to deploy feature-rich Customer Relationship Management solution with out-of-the-box but configurable business process automation. Access methods include both hosted and deployed models through a web browser.
